

# Introduction to Git

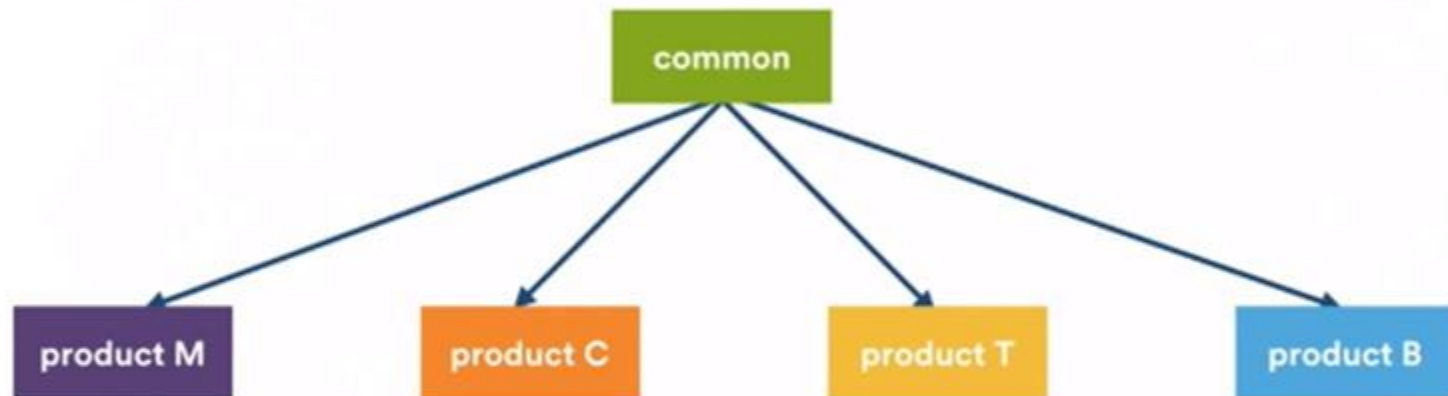

# Why do we need Branching?

## Develop Branch

- **Deploy Frequently**
- **Work on very small stories**
- **Work towards big goals, “epics”**
- **Work on some new experiments.**
- **Balance production fixes and ongoing development work.**
- **Keep the testing environments straight.**

## Develop Branch

**Let's say your organization is working on 4 products.**

**They use some common components, dependencies and libraries.**

**They also use some specific components, dependencies and libraries.**

# Branching-Merging Strategy Types

## Single Branch

**Single Branch**

**Every developer works on master branch.**

## Feature Branch

**Feature Branching**

**Developer can create a branch to work on new feature**

## Feature Branch

## Feature Branching

**Developer can merge back feature branch to master branch once it is complete.**

## Release Branch - CD

**Continuous  
Delivery**

**Staging Branch is then merged to release branch  
(Production Branch)  
From release branch the CD step can take off.**

## Long Running Versions - Release Branch - CD

**Version Specific release branches are created.**

## Long Running Versions - Release Branch - CD

**Long running release branches for the release which are on field.  
Bugfix branch to fix production bugs.  
Master always has the latest code.**

# Branching-Merging Strategy

## Develop Branch

**Every developer works on develop. Changes are merged back to master branch.**

**Master branch is always clean.**

## Develop Branch

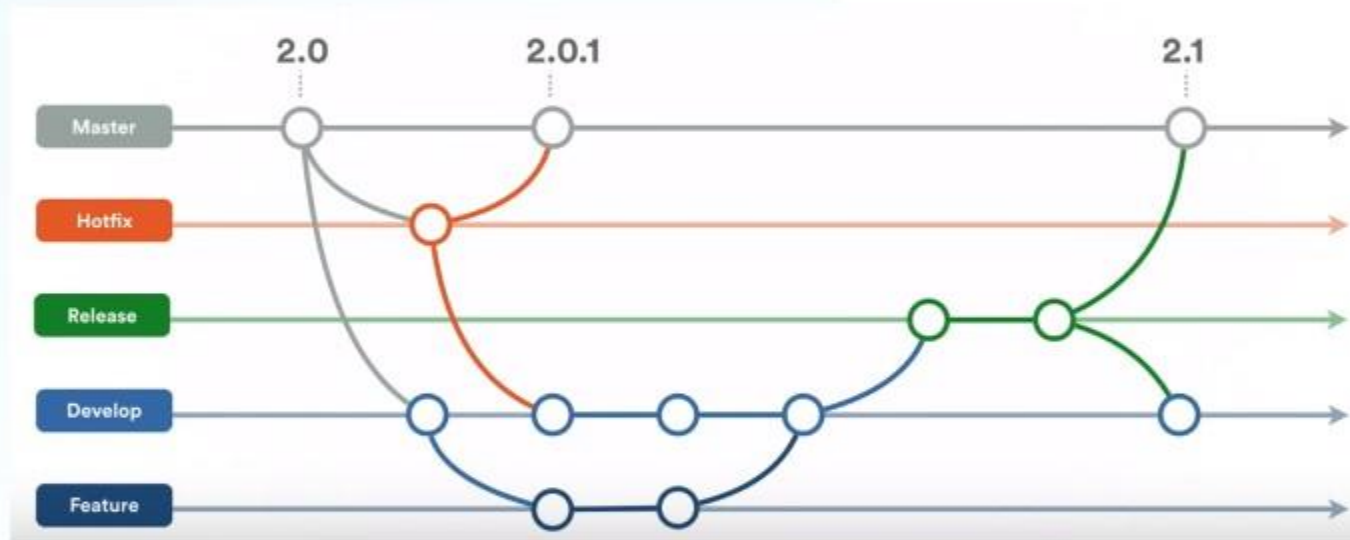

**In case of any issue in production, hotfix branch is created. Once everything is fixed in hotfix it is pushed to master and tagged. Then it is pushed to develop so that development progresses.**

# Develop Branch

**For working on a feature Developer must create a feature branch.  
Upon completion of feature they push back to develop branch.**

# Develop Branch

**Create release branch from develop branch.**

**Final testing is done here.**

**It is then pushed to master branch.**

**If there any changes they it is also pushed to develop branch.**

# Develop Branch

If we have hotfix for fixing bugs, why do we need support?

**Purpose of support differs from hotfix.**

**Support branch are for the changes which are not of latest version. These can also be for changes that are hard to merge. (Cherry-pick, hand merge or not merge at all)**

# Thank You
